Calving evaluation

- **In general**, Danish, Finnish and Swedish **correlations** between previous and current breeding values **are high** and in general as expected across all birth year classes. Somewhat lower correlations for birth year classes 2020 and 2024 for the Swedish SIM on the calving index are most likely to be due to changes in the data and added new added genotypes. Genetic group solutions for this group have been checked and are stable between the two consecutive evaluations.

Carcass evaluation

- Danish, Finnish and Swedish correlations between previous and current breeding values are high and in general as expected.

Calving

Correlations between previous and current evaluation for the subindex traits for publishable animals from the calving evaluation
